Chapter 3: Plate Tectonics

There are many plate boundaries and they have unique characteristics

Fossil Data and Continental Drift

- similar animals at boundaries between continents
- continents were all together at one time
- WW2 changed our perspective
- map where all the earthquakes happen, where all of the volcanoes were
- mountains in the belts

Three Types of Relative Plate Motions

Moving apart: divergent boundary (Atlantic ocean)

- Moving toward each other: Convergent Boundary
- same density
- the plate begins to melt at some depth and forms a chain of islands
 - move horizontally past one another: transform boundary (san andres fault)
 zig-zag pattern and is not a linear path for the fault

What moves the Plates

We are not sure what the root cause of the movement is
